Deep Multi-Task and Meta-Learning
Course Logistics
Information & Resources

Course website: http://web.stanford.edu/class/cs330/
Piazza: Stanford, CS330
Staff mailing list: cs330-aut1920-staff@lists.stanford.edu
Office hours: Check course website. (Mine are Weds after class)
Pre-Requisites and Enrollment

Pre-requisites: CS229 or equivalent, previous RL experience highly recommended

If you are not enrolled: fill out enrollment form on course website.
- We will enroll subject to availability
- Fill out the form as soon as possible!

Lectures are recorded, will be internally released on Canvas, will be publicly released after the course.

SCPD: There are ~20 remote students from SCPD as part of the course.
Assignment Infrastructure

Assignments will require training networks in TensorFlow (TF).

TF review section:
- Suraj Nair will hold a TF review session on Thursday, September 26.
- You should be able to understand the overview here: https://www.tensorflow.org/guide/low_level_intro
- If you don’t, go to the review session & ask questions!
Topics

1. Problem definitions
2. Multi-task learning basics
3. Meta-learning algorithms: black-box approaches, optimization-based meta-learning, metric learning
4. Hierarchical Bayesian models & meta-learning
5. Multi-task RL, goal-conditioned RL, hierarchical RL
6. Meta-reinforcement learning
7. Open problems, invited lectures, research talks

Emphasis on deep learning, reinforcement learning
Topics We Won’t Cover

Won’t cover AutoML topics:
- architecture search
- hyperparameter optimization
- learning optimizers

Emphasis will be on:
deep learning approaches
Course Format

Three types of course sessions:
- lecture (9)
- student reading: presentations & discussions (7)
- guest lecture (3)

All students responsible for one group paper presentation.
[Instructions posted on Piazza.]

Participation in discussions is highly encouraged.

[This will change in future offerings.]
Assignments & Final Project

Homework 1: Multi-task data processing, black-box meta-learning

Homework 2: Gradient-based meta-learning & metric learning

Homework 3: Multi-task RL, goal relabeling

Final project: Research-level project of your choice
Form groups of 1-3 students, you’re welcome to start early!

Grading: 20% paper presentation, 30% homework (10% each), 50% project
5 late days total across: homeworks, project paper submission
Homework Today

1. Sign up for Piazza
2. Fill out paper presentation preferences (by Thursday!)
3. Start forming final project groups if you want to work in a group
4. Review this: https://www.tensorflow.org/guide/low_level_intro
Two more things

Ask questions!

Because it is new, this course will be rough around the edges.
Some of My Research
(and why I care about multi-task learning and meta-learning)
How can we enable agents to learn skills in the real world?

Robots.

Why robots? Robots can teach us things about intelligence.

Robots faced with the real world must generalize across tasks, objects, environments, etc need some common sense understanding to do well supervision can’t be taken for granted
Beginning of my PhD

The robot had its eyes closed.

Levine et al. ICRA ’15
Our Method
autonomous execution

real-time

Finn et al. ICRA ‘16
Learn one task in one environment, starting from scratch
Behind the scenes…

Yevgen is doing more work than the robot! It’s not practical to collect a lot of data this way.
Learn **one task** in **one environment**, starting from **scratch**, relying on **detailed supervision and guidance**.

Not just a problem with reinforcement learning & robotics.

More diverse, yet still **one task, from scratch, with detailed supervision**
Humans are generalists.
Why should we care about multi-task & meta-learning?

...beyond the robots and general-purpose ML systems
Why should we care about multi-task & meta-learning?

...beyond the robots and general-purpose ML systems
Standard computer vision: hand-designed features

Modern computer vision: end-to-end training

Deep learning allows us to handle *unstructured inputs* (pixels, language, sensor readings, etc.) without hand-engineering features, with less domain knowledge
Deep learning for object classification

Large, diverse data (+ large models) \rightarrow \text{Broad generalization}

Russakovsky et al. ‘14

GPT-2
Radford et al. ‘19

Vaswani et al. ‘18

What if you don’t have a large dataset?

medical imaging, robotics, personalized education, translations

Impractical to learn from scratch for each disease, each robot, each person, each language, each task
What if your data has a long tail?

This setting breaks standard machine learning paradigms.
What if you need to quickly learn something new?

about a new person, for a new task, about a new environment, etc.
By Braque or Cezanne?
What if you need to quickly learn something new?
about a new person, for a new task, about a new environment, etc.

“few-shot learning”

How did you accomplish this?
by leveraging prior experience!
What if you want a more general-purpose AI system?
Learning each task from scratch won’t cut it.

What if you don’t have a large dataset?
medical imaging  robotics  personalized education, medicine, recommendations
translation for rare languages

What if your data has a long tail?
big data  small data

What if you need to quickly learn something new?
about a new person, for a new task, about a new environment, etc.

This is where elements of multi-task learning can come into play.
What is a task?
What is a task?

For now: dataset $\mathcal{D}$ \quad \rightarrow \quad model $f_\theta$

loss function $\mathcal{L}$

Different tasks can vary based on:

- different objects
- different people
- different objectives
- different lighting conditions
- different words
- different languages
- ...

Not just different “tasks”
The bad news: Different tasks need to share some structure. If this doesn’t hold, you are better off using single-task learning.

The good news: There are many tasks with shared structure!

- The laws of physics underly real data.
- People are all organisms with intentions.
- The rules of English underly English language data.
- Languages all develop for similar purposes.

Even if the tasks are seemingly unrelated:

This leads to far greater structure than random tasks.
Informal Problem Definitions

We’ll define these more formally next time.

The multi-task learning problem: Learn all of the tasks more quickly or more proficiently than learning them independently.

The meta-learning problem: Given data/experience on previous tasks, learn a new task more quickly and/or more proficiently.

This course: anything that solves these problem statements.
Doesn’t multi-task learning reduce to single-task learning?

\[ D = \bigcup D_i \quad \text{and} \quad L = \sum L_i \]

Are we done with the course?
Doesn’t multi-task learning reduce to single-task learning?

Yes, it can! Aggregating the data across tasks & learning a single model is one approach to multi-task learning.

But, we can often do better! Exploit the fact that we know that data is coming from different tasks.
Why now?

Why should we study deep multi-task & meta-learning now?
Multitask Learning is an inductive transfer mechanism whose principle goal is to improve generalization performance. MTL improves generalization by leveraging the domain-specific information contained in the training signals of related tasks. It does this by training tasks in parallel while using a shared representation. In effect, the training signals for the extra tasks serve as an inductive bias. Section 1.2 argues that inductive transfer is important if we wish to scale tabula rasa learning to complex, real-world tasks. Section 1.3 presents the simplest method we know for doing multitask inductive transfer, adding extra tasks (i.e., extra outputs) to a backpropagation net. Because the MTL net uses a shared hidden layer trained in parallel on all the tasks, what is learned for each task can help other tasks be learned better. Section 1.4 argues that it is reasonable to view training signals as an inductive bias when they are used this way.

Caruana, 1997

On the Optimization of a Synaptic Learning Rule

Samy Bengio  Yoshua Bengio  Jocelyn Cloutier  Jan Gecsei

Université de Montréal, Département IRO

This paper presents a new approach to neural modeling based on the idea of using an automated method to optimize the parameters of a synaptic learning rule. The synaptic modification rule is considered as a parametric function. This function has local inputs and is the same in many neurons. We can use standard optimization methods to select appropriate parameters for a given type of task. We also present a theoretical analysis permitting to study the generalization property of such parametric learning rules. By generalization, we mean the possibility for the learning rule to learn to solve new tasks. Experiments were performed on three types of problems: a

Bengio et al. 1992

They are often able to generalize correctly even from a single training example [2, 10]. One of the key aspects of the learning problem faced by humans, which differs from the vast majority of problems studied in the field of neural network learning, is the fact that humans encounter a whole stream of learning problems over their entire lifetime. When faced with a new thing to learn, humans can usually exploit an enormous amount of training data and experiences that stem from other, related learning tasks. For example, when learning to drive a car, years of learning experience with basic motor skills, typical traffic patterns, logical reasoning, language and much more precede and influence this learning task. The transfer of knowledge across learning tasks seems to play an essential role for generalizing accurately, particularly when training data is scarce.

Thrun, 1998
These algorithms are continuing to play a fundamental role in machine learning research.

Recommending What Video to Watch Next: A Multitask Ranking System

Zhe Zhao, Lichun Hong, Li Wei, Jinlin Chen, Aniruddh Nath, Shawn Andrews, Aditee Kulkarni, Mohummar Sridharan, Xinyang Yi, Ed Chi  
Google, Inc.  
zhaozhe,lichunhong,liwei,jinlinchen,aniruddhnath,shawn,andrews,aditeekulkarni,xinyangyi,edchi@google.com

In this paper, we introduce a large scale multi-objective ranking system for recommending what video to watch next on an industrial video sharing platform. The system faces many real-world challenges, including the presence of multiple competing ranking objectives, as well as implicit selection biases in user feedback.
These algorithms are playing a fundamental, and **increasing** role in machine learning research.
